Surety

Lending gauges for Mezo

veBTC holders decide where MUSD credit goes, and their rewards take *the first loss*.

One MUSD vault, steered by veBTC votes. The voters' own rewards stand in front of every credit line they back.

Surety

The problem

Plenty of BTC. Almost no *credit*.

804 BTC

locked in veBTC

Held by 1,796 holders. None of it can be borrowed against without unlocking. Mezo only does that for institutions, through Mezo Prime.

1

open trove

On Mezo's public MUSD CDP at block 12,705,315. Redemptions eat troves while MUSD trades about 1% under $1.

0

loss for whoever picks

In money markets today a curator or governance decides where deposits go. When the pick goes bad, it carries none of the loss.

WHAT MEZO ASKED FOR

Lending gauges: veBTC votes steer capital to lending markets, as a risk signal.

WHAT IT LEFT OPEN

The mechanism. It is saved for "a future post".

SURETY'S ANSWER

Make the vote cost something. The voters' rewards take the first loss.

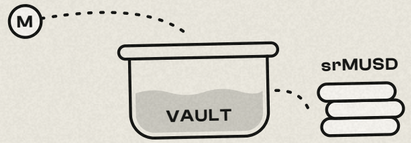

Surety

How it works

Four verbs, *one* vault.

Lenders bring the MUSD. veBTC holders steer it and stand behind their picks. Borrowers draw it with no redemption risk.

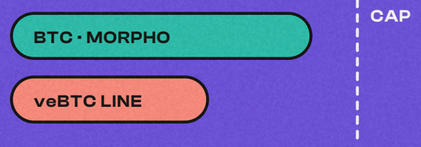

01 for lenders

Lend.

Deposit MUSD into a Morpho VaultV2 vault. You hold srMUSD shares.

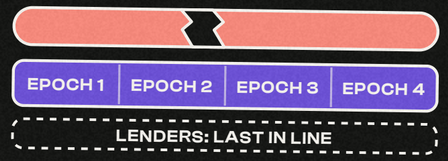

02 for veBTC holders

Vote.

veBTC power is snapshotted at epoch start. The allocator moves capital to match the votes, inside vault caps.

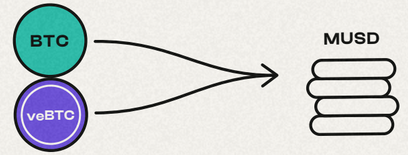

03 for the voters, again

Underwrite.

Voters earn 10% of interest plus sponsor incentives. Those rewards season 4 epochs and pay first if a line they backed goes bad.

04 for borrowers

Borrow.

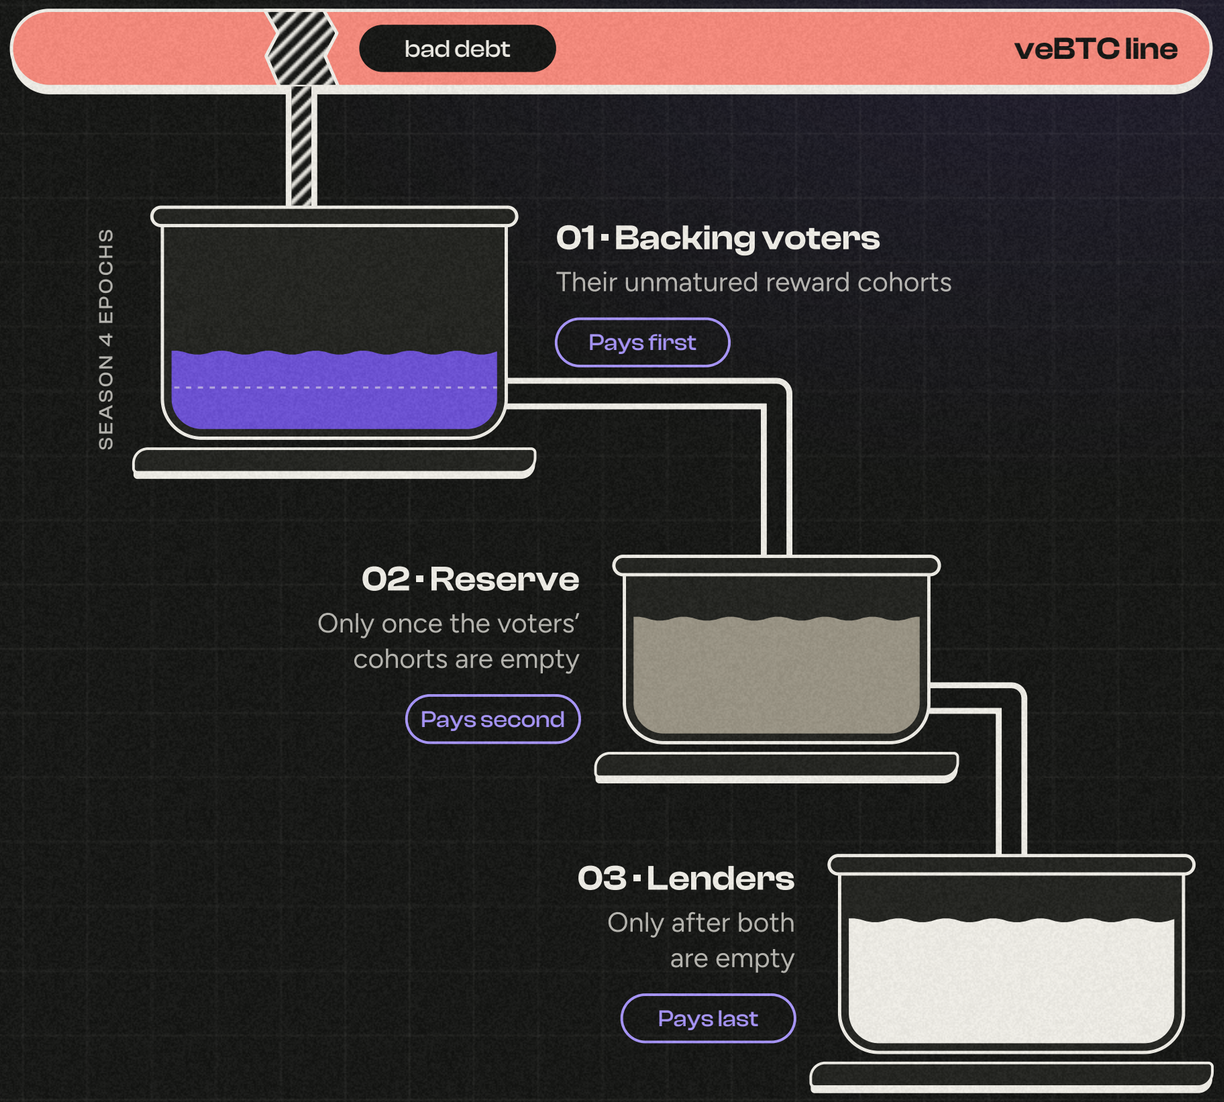

MUSD with no redemption risk: against BTC on Mezo's Morpho Blue, or against a locked veBTC that keeps voting.

Surety

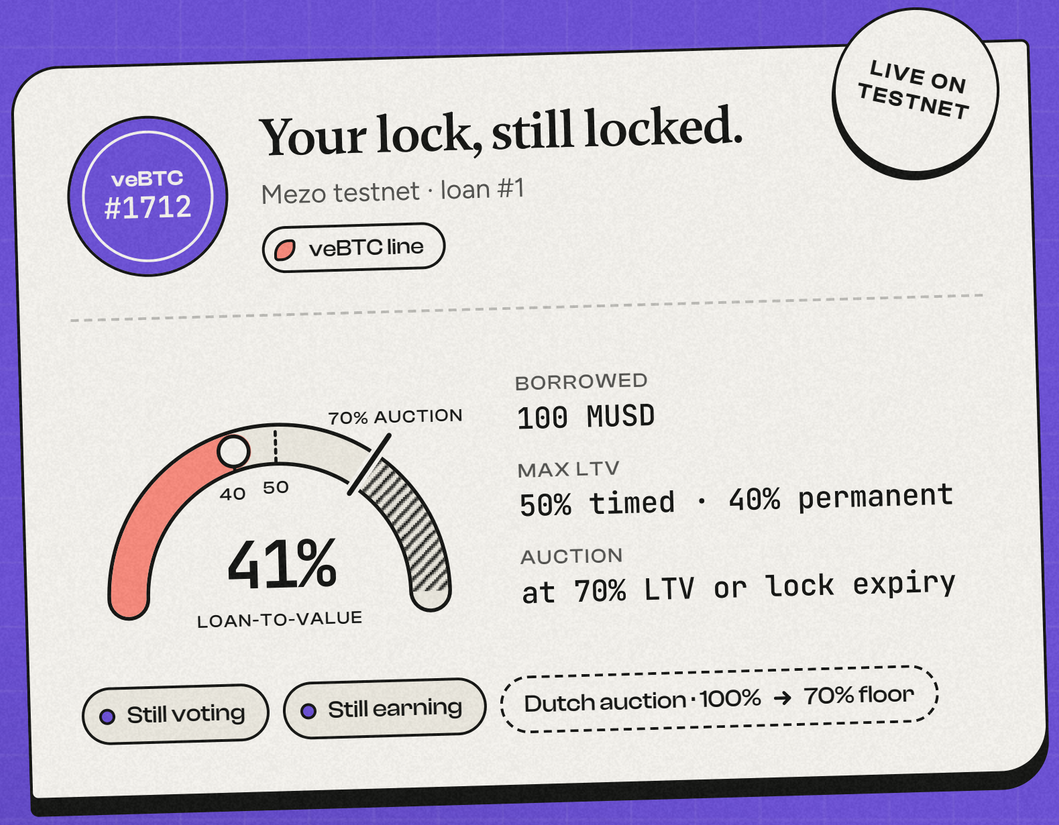

Who pays first

When a loan goes bad, the voters pay first.

Order	Backing voters' unmatured cohorts, then the reserve, then lenders.
Size	Cover is sized so lenders return to the pre-loss share price.
Gate	New deposits pause while a cover is re-recognised, so nobody can skim it.

Surety

Mezo Prime does this for institutions. Surety does it for any lock.

For veBTC holders

Borrow against your veBTC without unlocking it.

Stays locked	Each loan gets its own escrow. The lock keeps voting and earning on Mezo.
Borrow up to	50% LTV on a timed lock, 40% on a permanent one.
If it slips	At 70% LTV or at lock expiry, a Dutch auction runs from 100% of the lock's value down to a 70% floor.
No redemptions	The MUSD comes from the vault, so nobody can redeem against you.

Surety

Built on Mezo

Made from Mezo's *own* parts.

MUSD 01

`lent · borrowed · incentives`

What lenders deposit, borrowers draw and sponsors post.

veBTC 02

`votingPowerOfNFTAt`

Vote weight, snapshotted at the start of each epoch.

Mezo voting + rewards 03

`PoolsVoter · RewardsDistributor`

Reached through each loan's escrow, so a pledged lock keeps voting and claiming.

Skip BTC/USD 04

`precompile · fail-closed at 60 s`

Prices every loan and auction. A price older than 60 s stops them.

Morpho Blue on Mezo 05

`LLTV 0.86 · AdaptiveCurveIrm`

The BTC market the vault supplies, where BTC holders borrow MUSD.

VaultV2 + adapter 06

`MorphoMarketV1AdapterV2`

Morpho's vault and adapter, vendored unmodified at the exact commits Mezo runs.

GAUGE-READY

Mezo's own `ERC4626VaultAdapter` fits the vault. One governance call switches on MEZO emissions for lenders.
