Surety

Lending gauges for Mezo

veBTC holders decide where MUSD credit goes, and their rewards take *the first loss*.

Lend MUSD with the voters' rewards standing in front of you, or borrow against your veBTC without unlocking it.

Live on Mezo mainnet · v2

Surety

The problem

Plenty of BTC. Almost no *credit*.

804 BTC

locked in veBTC

Held by 1,805 holders. None of it can be borrowed against without unlocking.

0

loss for whoever picks

In money markets a curator or governance decides where deposits go, and carries none of the loss when the pick goes bad.

0.05 %

a year from sMUSD, lately

About what Mezo's savings rate has paid. MUSD holders need somewhere productive and safe to earn.

THIS WEEK ON MEZO

5 Nov: an Enclave repaid 10.51M MUSD and pulled its liquidity.

MUSD supply `29.48M → 19.02M` sMUSD `7.38M → 1.29M` MUSD in the CL mUSDC/MUSD pool `5.33M → 7.5k`

From Mezo's blog · "Aerodrome for lending"

"...the system cannot tell who is serious"

mezo.org/blog/aerodrome-for-lending

WHAT MEZO ASKED FOR

Lending gauges: veBTC votes steer capital to lending markets, as a risk signal.

WHAT IT LEFT OPEN

The mechanism. It is saved for "a future post".

SURETY'S ANSWER

Make the vote cost something. The voters' rewards take the first loss.

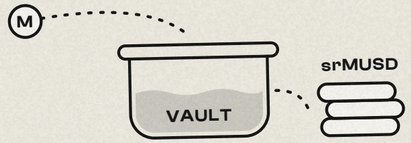

Surety

How it works

Four verbs, *one* vault.

Lenders bring the MUSD. veBTC holders steer it and stand behind their picks. Borrowers draw it with no redemption risk.

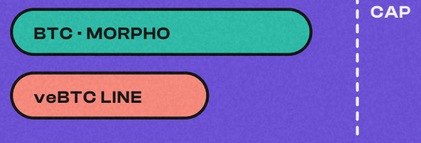

01 for lenders

Lend.

Deposit MUSD into a Morpho VaultV2. You hold srMUSD; idle MUSD waits in Mezo's sMUSD.

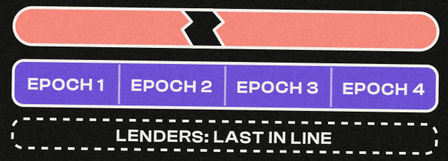

02 for veBTC holders

Vote.

veBTC power is snapshotted at epoch start. The allocator moves capital to match the votes, inside vault caps.

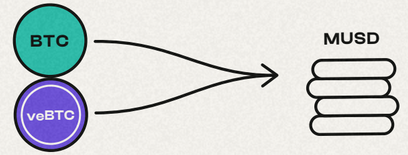

03 for the voters, again

Underwrite.

Voters earn 10% of interest plus sponsor incentives. Those rewards season 4 epochs and pay first if a line they backed goes bad.

04 for borrowers

Borrow.

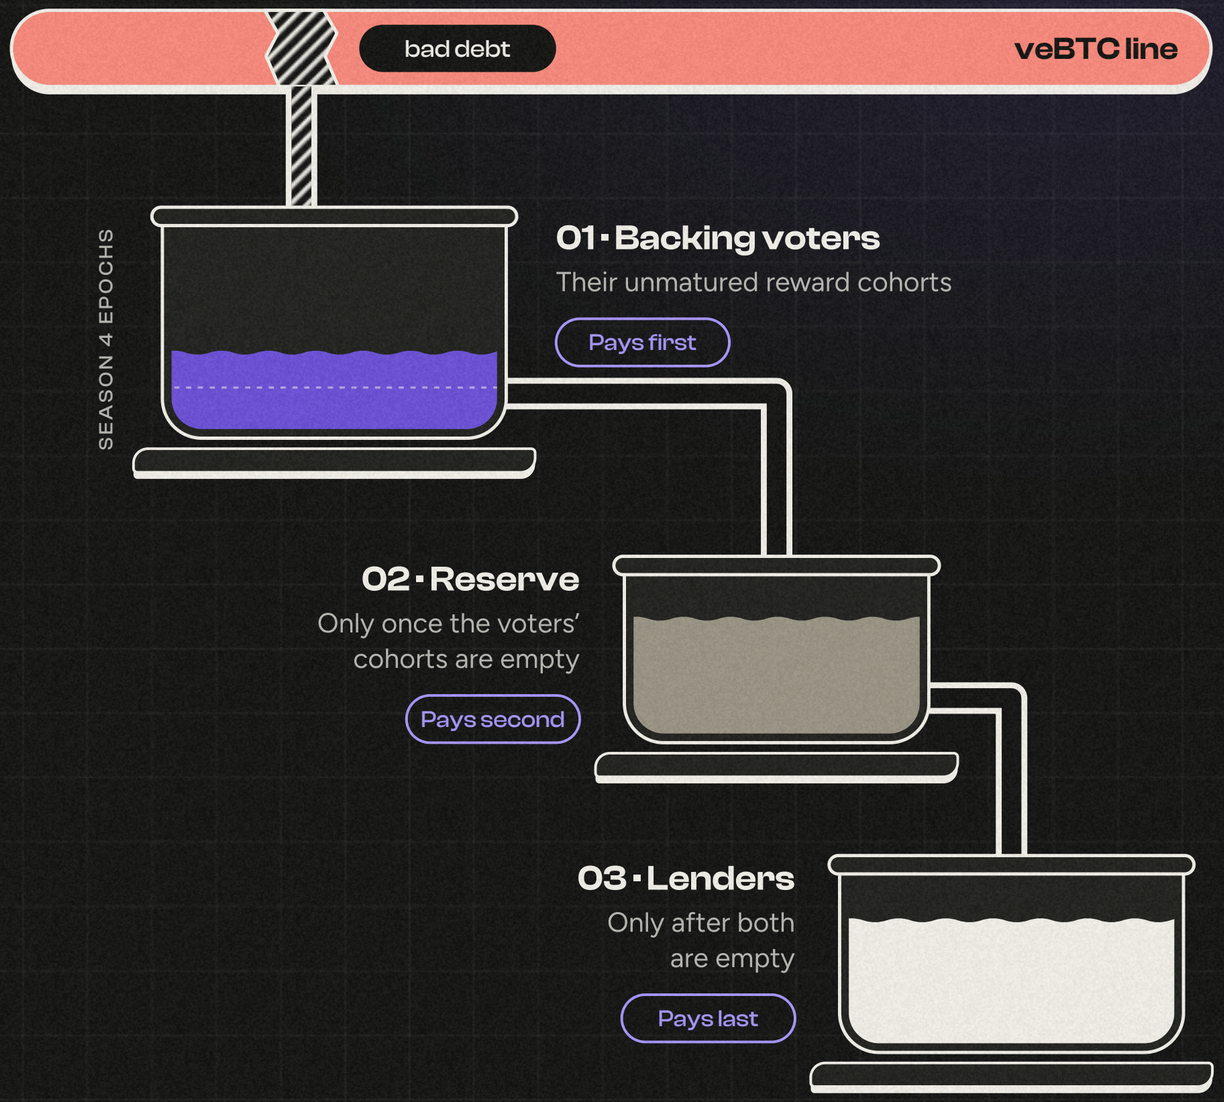

MUSD with no redemption risk: against BTC on Mezo's Morpho Blue, or against a locked veBTC that keeps voting.

Surety

Who pays first

When a loan goes bad, the voters pay first.

Order	Backing voters' unmatured cohorts, then the reserve, then lenders.
Size	Cover is sized so lenders return to the pre-loss share price.
Gate	New deposits pause while a cover is re-recognised, so nobody can skim it.

Surety

What changed since Wave 1

Seven review points. Six *done*.

	THE WAVE 1 REVIEW ASKED FOR	WHAT V2 SHIPPED	STATUS ON 12 NOV
01	**Escrow vote and claims on chain**	Bribe, fee and rebase claims on testnet; a harvest paid down the loan	Done
02	**Real MUSD in the mainnet vault**	2.5 MUSD in, lent on Mezo's own Morpho Blue and against veBTC	Done
03	**Outside users borrowing**	Starter kits, a no-install Try it and a public users ledger	No outside users yet
04	**A MUSD/USD price, not $1**	MusdPeg reads Mezo's pools; a borrow at $0.94 reverted on chain	Done
05	**A wider trigger-to-floor gap**	Auctions start at 65% LTV and stop at an 85% floor (was 70% and 70%)	Done
06	**Who pays the team**	Four protocol fees to a treasury, each one paid on chain	Done
07	**The app loads fast**	Static first paint, time-boxed RPCs, checked in headless Chrome	Done

Every point with its commits, transactions and checks: `FEEDBACK-RESPONSE.md` in the repository

Surety

The MUSD peg

Priced by Mezo's *own* pools.

Sources	Four of Mezo's pools: CL and basic mUSDC/MUSD, basic MUSD/mUSDT, and CL BTC/MUSD × Skip BTC/USD.
Checks	A CL source needs a liquidity floor over its 30-minute window; a basic pool, an observation under 6 h old.
Median	Healthy when 2 or more sources read, agree within 1,000 bps, and the median is within 300 bps of $1.
Clamp	BTC in MUSD is BTC/USD ÷ the median, clamped to [$1, $1.03]. Never above BTC/USD.
Breaker	While unhealthy, new borrowing and new allocations stop. Repayments, auctions and withdrawals go on.

MEZO MAINNET · AT LAUNCH — block 13,118,945

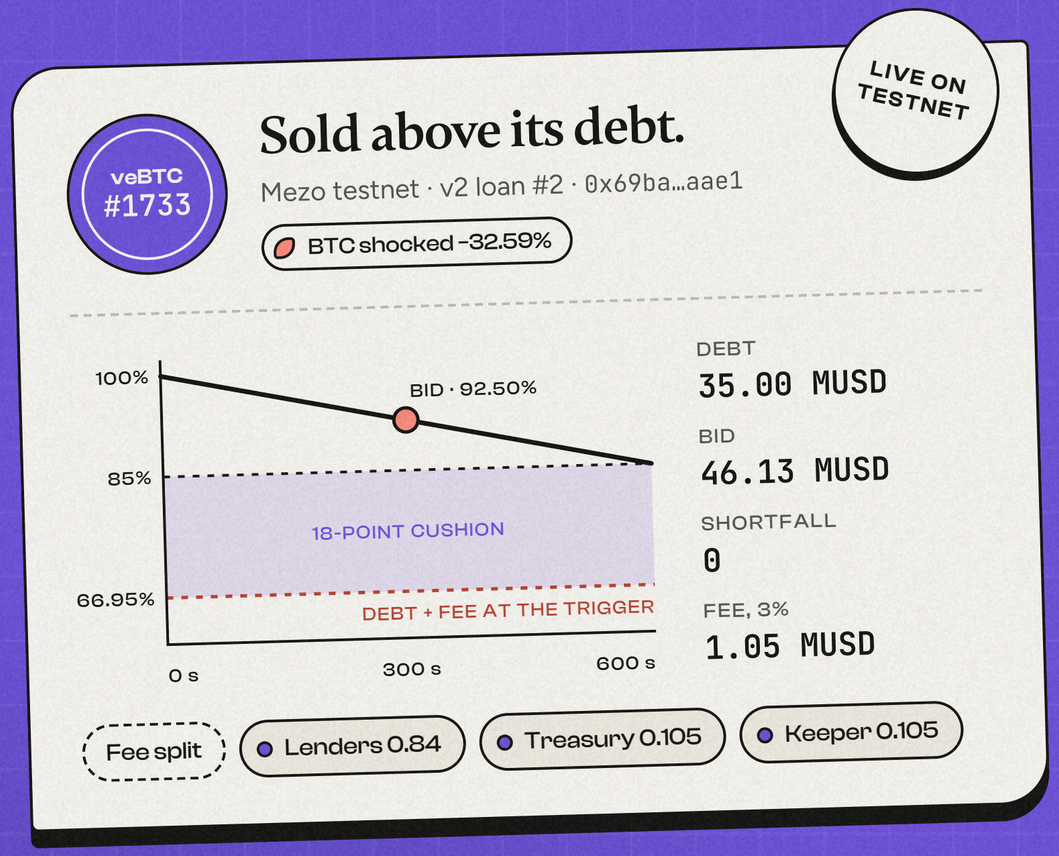

~~CL mUSDC/MUSD~~	*under its liquidity floor*
Basic mUSDC/MUSD	0.991271
~~Basic MUSD/mUSDT~~	*13.8 h old, past 6 h*
CL BTC/MUSD × Skip	0.999005

0.9951

Healthy

2 of 4 sources read, 78 bps apart and 49 bps under $1: borrowing open, BTC priced at BTC/USD.

TESTNET MUSD forced to $0.94. A borrow sent anyway reverted on chain with **`PegUnhealthy`**. `0x6438…8e16`

In v1 an auction could clear below the debt by design. In v2 the floor sits above it.

Liquidations

An 18-point cushion before any shortfall.

Trigger	65% LTV, or lock expiry. Was 70%.
Floor	The auction falls from 100% of the lock's value to an 85% floor. Was 70%.
Cushion	At the trigger, debt plus the 3% fee is at most 66.95%. The contract refuses a floor below that.
Fee split	80% to lenders, 10% to the treasury, 10% to whoever starts the auction.

Surety

For veBTC holders

Your veBTC repays its *own* loan.

01 for the borrower

Lock.

Borrow up to 50% LTV, 40% on a permanent lock. The NFT moves into its own escrow.

02 on Mezo

Vote.

The escrow still votes the NFT on Mezo's gauges, wherever the borrower picks.

03 on Mezo

Earn.

Fees and bribes accrue to the NFT. The veBTC rebase grows the lock.

04 anyone can call it

Repay.

With auto-repay on, a harvest turns the MUSD into repayment. Other tokens go to the borrower.

On chain · Mezo testnet · v2 loan #1, veBTC #1732

AUTO-REPAY	ESCROW VOTE	BRIBE	HARVEST · 12 NOV
Switched on	100% on MUSD/mUSDC	20 MUSD on that gauge	0.1676 MUSD repaid
0x30a8…fc41	0x1a50…0430	0x203f…ad0f	0x04be…09e6

Surety

For lenders

Idle cash in sMUSD. A market for *lender shares*.

sMUSD idle cash, parked on Mezo

The vault's idle MUSD, its 10% buffer included, sits in Mezo's sMUSD as VaultV2's liquidity adapter. Withdrawals pull from it.

100 MUSD deposit lands in sMUSD
`0xe25a…51f8`

Rebalance sends 108 to the lines; 12 stays parked
`0x5fe4…c5b2`

Honest yield. sMUSD has paid about 0.05% a year lately. This keeps cash productive on Mezo; it is not a source of return.

ShareMarket a way out when the cash is lent

When the vault's cash is lent out and a redeem would fail, a lender can sell srMUSD at a discount to the live share price.

20 srMUSD listed 1% under the share price
`0x7021…af2f`

10 srMUSD filled for 9.9004 MUSD; 0.0099 to the treasury
`0x741e…de8a`

No owner. Fills wait while deposits are paused after a loss; `cancelAndRedeem` stays open.

Surety

Business

Small fees. Break-even near *4.1M*.

Borrowers BTC and veBTC

Borrow interest, origination and liquidation fees

LENDERS

Interest

The rest of the borrow interest, plus 80% of every liquidation fee.

veBTC VOTERS

10%

Of interest, for standing first in line for losses. Plus sponsor incentives.

TREASURY

4 fees

`0.25%` origination
`0.20%`/yr management
`10%` of liquidation fees
`0.10%` of share sales

TREASURY INCOME · MUSD A YEAR

At the caps 4,000 MUSD in the vault	20.5
At $1M	5,118
At $10M	51,180
Running costs operations and one review a year	-21,200

Fees cover the costs from about 4.1M MUSD in the vault.

WHO PAYS THE TEAM

Nobody yet.

Engineering & security

Tested like it already holds *money*.

379

Foundry tests

Including 15 invariants at 256 runs × 64 actions, and 16 review regressions.

173

TypeScript tests

Across the SDK, the keeper, the MCP server and the web app.

0

open high or medium

Across two independent reviews, of v1 and of the v2 changes.

19/19

exact match on Sourcify

Every v2 mainnet contract. Mezo's Blockscout lists no compilers right now.

v2 review	`1 high · 2 medium · 2 low`	All five fixed, each with regression tests
v1 review	`4 medium · 6 low`	All four medium and 5 of 6 low fixed; 1 low acknowledged

Not an external audit yet. Owner roles stay on one key until a timelock and a multisig take over.

`surety-credit.vercel.app/app/proof`

`github.com/RaYYeR220/surety`

Surety

Try it

A testnet loan in about a minute.

No wallet and nothing to install. A key kept in the browser signs, and a starter kit pays for everything.

`surety-credit.vercel.app/app/try`

No time? `/app?demo=1` shows every page on example data.

`/app/ledger` Every wallet that has used Surety, on both networks. Team wallets are labelled, not hidden.

The path

Mezo testnet

01 **Claim a starter kit**
0.00005 BTC for gas, a 0.001 BTC veBTC lock and 30 test MUSD. One per wallet.

02 **Borrow against the kit's veBTC**
The lock moves into an escrow of its own and stays yours.

03 **Turn on auto-repay**
Anyone may then harvest its rewards into repayment.

04 **Vote the escrowed veBTC on Mezo**
The escrow votes Mezo's pools while the loan is open.

05 **Repay**
The loan closes and the veBTC comes back.
